

# Errata for C# and Algorithmic Thinking for the Complete Beginner

## 1.2 What is Hardware?

➤ **The Central Processing Unit (CPU)**

This is the part of a computer that actually performs all the tasks defined in a program (**basic arithmetic, logical, and input/output operations.**)

## 5.11 Review Exercises

2. Match each element from the first column with one element from the second column.

Value	Data Type
1. The name of a person	<b>a.</b> Boolean
2. The age of a person	<b>b.</b> Real
3. The result of the division 5/2	<b>c.</b> Integer
4. Is it black or is it white?	<b>d.</b> String

## 13.1 Introduction

### Exercise 13.1-2 Finding the Sum of Digits

#### First Approach

Step	Statement	Notes	number	digit1	digit2	digit3	digit4	r	sum
...	...		..	..	..	..	..	..	..
8	sum = digit1+digit2+digit3+digit4		6753	6	7	5	3	53	<b>21</b>
9	Console.WriteLine(sum)	Value <b>21</b> is displayed							

#### Second Approach

Once more, let's try to understand the second approach using an arithmetic example. Take the same number, 6753, for example.

<b>Fourth digit = 3</b>	The fourth digit can be isolated if you divide the given number by 10 to get the integer remainder <b>digit4</b> = 6753 % 10
<b>Remaining digits = 675</b>	The remaining digits can be isolated if you divide the given number by 10 to get the integer quotient r = (int)(6753 / 10)
<b>Third digit = 5</b>	The third digit can be isolated if you divide the remaining digits by 10 to get the integer remainder digit3 = 675 % 10

<b>Remaining digits = 67</b>	The remaining digits are now <code>r = (int)(675 / 10)</code>
<b>Second digit = 7</b>	The second digit can be isolated if you divide the remaining digits by 10 to get the integer remainder <code>digit2 = 67 % 10</code>
<b>First digit = 6</b>	The last remaining digit, which happens to be the first digit, is <code>digit1 = (int)(67 / 10)</code>

## 13.2 Review Exercises

- Write a C# program that prompts the user to enter an integer representing an elapsed time in seconds and then displays it in the format “WW weeks DD days HH hours MM minutes and SS seconds.” For example, if the user enters the number 2000000, the message “3 weeks 2 days 3 hours 33 minutes and 20 seconds” should be displayed.

## 25.1 The Pre-Test Loop Structure

### Exercise 25.1.3 Designing the Flowchart and Counting the Total Number of Iterations

Now, let's create a trace table to observe the flow of execution.

Step	Statement	Notes	i
1	<code>i = 1</code>		1
2	<code>while (i != 6)</code>	This evaluates to true	
3	<code>i += 2</code>		3
4	<code>while (i != 6)</code>	This evaluates to true	
5	<code>i += 2</code>		5
6	<code>while (i != 6)</code>	This evaluates to true	
7	<code>i += 2</code>		7
8	<code>while (i != 6)</code>	This evaluates to true	
9	...	...	
10	...	...	

1<sup>st</sup> Iteration (Steps 2-3)  
2<sup>nd</sup> Iteration (Steps 4-5)  
3<sup>rd</sup> Iteration (Steps 6-7)

## 29.8 Converting from a While-Loop to a For-loop

### Exercise 29.8-3 Converting the Java Program

```

project_29_8_3b

static void Main() {
    int i;
    double s;

    s = 0;
    i = 1;
    for (i = 1; i <= 5; i++) {
        s = s + Math.Pow(i + 1, 2);
    }

    Console.Write(s);
}

```

```
Console.ReadKey();  
}
```

## 31.8 Review Exercises

7. Write a C# program that displays all four-digit integers that satisfy all of the following conditions:
- the number's first digit is greater than its second digit
  - the number's second digit is equal to its third digit
  - the number's third digit is smaller than its fourth digit

For example, the values 7559, **3112**, and 9889 are such numbers.

## 37.4 Sorting Lists

### Exercise 37.4-1 The Bubble Sort Algorithm – Sorting One-Dimensional Lists with Numeric Values

#### Fifth pass

##### 1st Compare

Elements at index positions 4 and 5 are compared. Since the value 49 is **not** less than the value **25**, **no** swapping is done.

## 40.3 Formal and Actual Arguments

**Remember!** There is a one-to-one match between the formal and the actual arguments. The value of argument *a* is passed to argument **n1**, the value of argument *b* is passed to argument **n2**, and so on. Moreover, the data type of the formal and the data type of the corresponding actual argument must match. You cannot, for example, pass a string to an argument of type integer!

## 43.1 Simple Exercises with Subprograms

### Exercise 43.1-5 How Many Times Does Each Number of the Dice Appear?

```
//Variable n1 is assigned the number of times that value 1 exists in array a  
n1 = search_and_count(1, a);  
//Variable n2 is assigned the number of times that value 2 exists in array a  
n2 = search_and_count(2, a);  
.  
.  
.  
//Variable n6 is assigned the number of times that value 6 exists in array a  
n6 = search_and_count(6, a);  
  
//Display how many times each of the six numbers appears in array a  
Console.WriteLine(n1 + " " + n2 + " " + n3);  
Console.WriteLine(n4 + " " + n5 + " " + n6);  
  
//Find maximum of n1, n2,... n6  
max = n1;  
max_i = 1;  
  
if (n2 > max) {  
    max = n2;  
    max_i = 2;  
}  
  
if (n3 > max) {
```

```
max = n3;
max_i = 3;
}
.
.
.
```

## 43.2 Exercises of a General Nature with Subprograms

### *Exercise 43.2-3 Progressive Rates and Electricity Consumption*

project\_43\_2\_3

```
...

static double find_amount(int kwh) {
    double amount;

    if (kwh <= 400) {
        amount = kwh * 0.08;
    }
    else if (kwh <= 1500) {
        amount = 400 * 0.08 + (kwh - 400) * 0.22;
    }
    else if (kwh <= 3000) {
        amount = 400 * 0.08 + 1100 * 0.22 + (kwh - 1500) * 0.35;
    }
    else {
        amount = 400 * 0.08 + 1100 * 0.22 + 1500 * 0.35 + (kwh - 3000) * 0.50;
    }

    amount += 0.26 * amount;
    return amount;
}

...
```
